The SEO/AEO audit sometimes presents information that isn't aligned with the findings from our development team.

Recommended process update: Before an SEO plan is shared with a client, it should first be reviewed by a developer to ensure the recommendations are technically accurate and feasible.

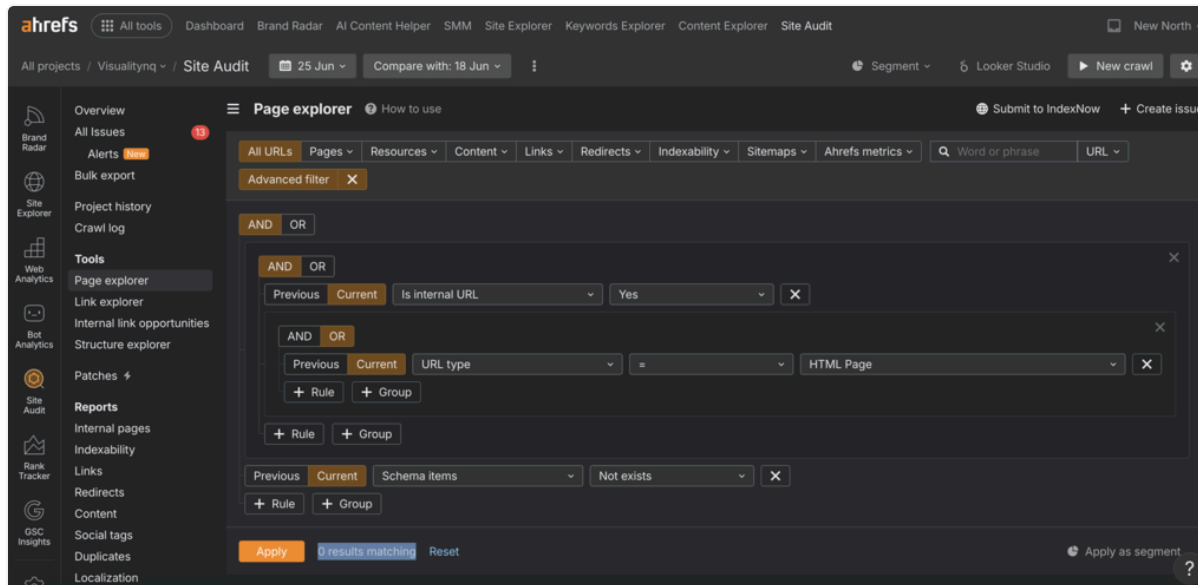

Examples:

1. Visuality Systems

Compass claim: "Only 4 pages out of 150 crawled have any structured data — leaving 97% of the site without schema markup. For a B2B software company selling commercial protocol libraries (jNQ, YNQ, jMount), the absence of Product, SoftwareApplication, and FAQPage schema on product and resource pages means Google cannot generate rich results and AI engines lack structured entity signals."

From Alberto: "the report only mentions that there are 150 pages affected but doesn't make a list of what pages are those. I tried to do something here in Ahrefs making a page research using a advanced filter and filtering by pages with no Schema items, actually it couldn't find any pages without any schema, I'm sending a screenshot showing the search.

Actually, it seems accurate as I'm taking a look at some random different pages in the site and I can find at least the WebPage schema coming from Yoast, which places it generally in the site... so it makes wonder even more why the report returned that amount of pages without any schema"

2. Actuate

Compass claim: "169 backlinks from Telegram-based link manipulation services (@SEO_ANOMALY, @BHS_LINKS, @SEO_CARTEL) across 169 unique domains. These represent 6.5% of anchored links and carry real algorithmic penalty risk."

From Alberto: "The report seems not accurate, I couldn't find any external URLs in this report: <https://app.ahrefs.com/site-audit/10032486/external-urls>"
